Thank You a lot for the nice talk on mobile

Good day, Dames and Gentlemen.

Thank You a lot for You call today. This day is the day of the good fortune.

I shall like to read on vacancy You propose now to Software Devs.

I am now in the **investitions** lookup period, and started to build a **portfolio site,**
and since 4 months this site is still under development, and the overview page is not done, and still think I have to work on this site
2 months.

For example, a basic template html file for projects **from scratch,** however at once with some
css default styles reset and erased, for css **responsive,** too.

there You will notice in the theme .small that the background around is not logic thought 100% the right way. Other basic css themes normal.

workspace.brightday.email/CssTools/CssCleanStart/index.template.html

For my **free** project, jaisocx.com server, even **the most base** feature
"Files View, published on a web endpoint" needs many months development:

workspace.brightday.email/CssTools/CssCleanStart/

You will see there:

no **responsive** done. no **order by** on files view columns available. no **filtering** available.
no **theming** or styling for customization.
can not neither switch **server side rendering** to **client side rendering** nor vs.

And now I have to publish already done branch with **CORS and custom headers feature,**
and shall like to have money to **transfer payments to a software dev,**
he will like to develop features like these.

The idea of my portfolio is, to publish a nice seeing **presentation site** with code on **Github,** and the presentation site will have the set of **Sites' UI Tools like Angular Material Design.**

Why the tools, these I build, are of use, too: I have implemented **BigData rendering** with **css theming** available.

However, I still did not implement the well seeing **CSS Theming UI Tool,** and for this I have built already Tree and Tooltip.

I send You these examples, the Tree and the Tooltip:

Tooltip (maybe I shall use this for **ContextMenu** when modifying Tree. This was the first thought how to write the **modifying the Tree data**)
URL: Workspace.brightday.email/ExampleWebpack_Tooltip_withCssCleanStart.html

Tree rendring any Object or Array. This page can apply 3 themes for the site, not the Tree.
URL: Workspace.brightday.email/ExampleSimple_ObjDataByPhpEndpoint.html

Tree, rendered with configuration
can be extended via datatypes in ObjData format, for example datatype image webp base64.
URL: Workspace.brightday.email/ExampleSimple_TreeRenderingModeConf.html

Tree, rendering Big Data 14MB
URL: Workspace.brightday.email/ExampleWebpack_Tree_BigTestData.html

Tree with 2 Styling Themes. To watch the other Theme You will need to scroll this example site:
URL: Workspace.brightday.email/ExampleSimple_TreeRenderingModeEase.html

The code of this Project on **Github** site: Github.com/Jaisocx-Tools/Workspace

Code of the Css Clean Start URL: npm pack on the Github, with fonts files
URL: npm pack on the Github, without fonts files, size of this pack is 4 KB
URL: Github.com/Jaisocx-Tools/Workspace/tree/main/code/ts/www/CssTools/CssCleanStart

Code of the Tree URL: npm pack on the Github
URL: Github.com/Jaisocx-Tools/Workspace/blob/main/code/ts/www/packages/Tree/
(for navigation and themes variables structure and groups)

Code of the Tooltip URL: Npm pack on the Github
URL: Github.com/Jaisocx-Tools/Workspace/blob/main/code/ts/www/packages/Tooltip/

friendly greetings,

Elias Polianskyi
